ramith-k-s | ramithks
Bengaluru, India

PROFESSIONAL SUMMARY

Backend engineer and former founder focused on AI-enabled applications. Builds Python/FastAPI order services and Kafka workflows at Kanmalai Technologies for client Thermo Fisher Scientific. Project work includes OpenRouter LLM integration, response parsing, caching and fallbacks.

PROFESSIONAL EXPERIENCE

Kanmalai Technologies | Client: Thermo Fisher Scientific
Software Development Engineer II
Feb 2026 - Present | Bengaluru, Karnataka, India (Hybrid)
E-commerce checkout and order-processing backend

- Develop Python/FastAPI RESTful microservices for checkout and order processing on Kubernetes, with structured errors, retries and integration tests.
- Implement Kafka-based acknowledgement processing, validation and status updates across asynchronous order workflows.

Zolnoi Innovations
Software Development Engineer
Oct 2024 - Jan 2026 | Bengaluru
Industrial analytics application platform

- Led backend API development and maintenance for the application platform, working with engineering and product teams.
- Integrated database and reporting services, improving API error handling, reliability and system performance.

JustPoll (Streetlab Internet Pvt Ltd)
Founder & CTO
Jul 2021 – Aug 2024 | Bengaluru
Social polling platform

- Founded a social polling platform and developed its TypeScript backend and Flutter mobile application, using PostgreSQL and Redis.
- Managed cloud deployment and delivery workflows on AWS, with Docker, CI/CD and operational monitoring.

TECHNICAL SKILLS

API engineering: Python, FastAPI, TypeScript, Node.js / Express; REST APIs, validation, access control
Async systems: Kafka, retries, scheduled jobs, persistent state, session authentication
Data & storage: PostgreSQL, Redis, D1 / SQLite; CSV ingestion, data-quality checks, evidence-linked rules
Delivery & testing: Kubernetes, Docker, AWS, Cloudflare Workers; CI/CD, Pytest, integration tests
Applied AI: Retrieval-augmented generation (RAG), vector search; OpenRouter LLM APIs, prompts, response parsing, caching and fallbacks

EDUCATION

Bachelor of Computer Applications | Christ University, Bengaluru | 2018 – 2021

PROJECTS

AlgoHabit | AI-assisted learning companion

TypeScript, React, OpenRouter API

- Integrated OpenRouter chat completions for learning recommendations and personalised feedback, with prompt templates and JSON response parsing.
- Added recommendation caching, client-side request checks and static fallbacks so core learning flows work without AI.

Berthbell | Shipment exception desk

berthbell.com

TypeScript, Cloudflare Workers, D1, React, Python

- Developed shipment CSV ingestion and workspace-scoped exception APIs with input validation, access checks and upload quotas.
- Built deterministic status rules with source timestamps and evidence, separating missing or stale coverage from reported schedule changes.
- Connected a React workspace to the API for reviewing shipment exceptions. Current maritime source coverage is regional, not global tracking.

Gundi | Road reporting and measurement research

gundi.in

Python, NumPy, SciPy, JavaScript, MapLibre

- Built a reporting interface with map-based location selection, official ward-boundary context and source-linked repair guidance.
- Implemented a Python geometry core for road-surface fitting, pothole dimensions, uncertainty propagation and repair comparison.
- Tested measurement logic on synthetic cavity cases and added abstention gates when scale or geometry evidence is insufficient.

Meanwhile | Persistent shared-world simulation

JavaScript, Cloudflare Workers, D1, OAuth

- Built a persistent simulation backend with scheduled world updates, shared state and character interaction workflows.
- Implemented email/password and Google/GitHub sign-in, expiring revocable sessions and transactional account-recovery flows.

HelpMyBuddy | Team-built emergency-help application

github.com/SiliconNinjas/HelpMyBuddy

Node.js, Express, TypeScript, PostgreSQL

- Developed the TypeScript/Express backend and PostgreSQL integration for a team-built mobile emergency-help application.
- Worked alongside dedicated frontend and ML contributors to connect mobile workflows with backend services.
